## ABSTRACT:

PROBLEM TO BE SOLVED: To provide a method for processing audio information through a client processing system connectable through a network to a server processing system and connectable to an audio output device.

SOLUTION: A web browser software is housed in a set top box connected to a television, and executed by a processing system to communicate through a wide area network with one or plural servers. While using a remote controller, a user can navigate a gap between hyper text anchors in a world wide web page displayed on the television through a browser. The browser can download an audio file from a web site and can generate sounds from the speaker of television based on the audio file. A background music audio file from a server can be downloaded while the other background music audio file is reproduced.
